DARVALLVET A DIVISION —OF— **AAS** ADVANCED ANESTHESIA SPECIALISTS

Developing Better Anesthesia Equipment and Better Anesthetists Since 1996

DARVALL We Warm Animals

Software User Manual
Using the
HBC /ZDS
Warm Inspired Air Control Unit

Use with

Darvall Heated Smooth-Wall Circuits (HBC)
On Circle Systems for Cats, Dogs and other small animals up to 80Kgs

or

Darvall Heated Qubes (ZDS)
A Non-Rebreathing System for Rodents, Birds, Exotics, Reptiles, Pups and Kittens

For Veterinary Use Only
(Not intended, evaluated, or approved for Human Medical purposes)

Certified By MET Laboratories to IEC / EN 61010-1
(Electrical equipment for measurement, control, and laboratory use)

Contents

What the software does

This software is provided for use with the Advanced Anaesthesia Heated Breathing Circuit controller. It provides the following prime functions: -

1. Temperature and event recording interface that may be annotated, viewed and exported into other analysis software (such as Excel).
2. Controller setup and adjustment, to control the temperature operating point and default metric / imperial units
3. Facility for upgrading the controller firmware from the AASmedical.com web site.

Software Requirements

The AAS Heated Breathing Circuit software (AAS HBC) will run on a Windows compatible computer with Windows 10

The Operating system must run the .Net Framework4.0 (or higher) software library. This is generally already installed in a Windows 10 system; but can be downloaded from www.microsoft.com/net

A version of Microsoft Excel, Open Office Calc, access to Google Sheets or any other program capable of opening a CSV file is required to view logged data files

Additional Hardware requirements: - one free USB port
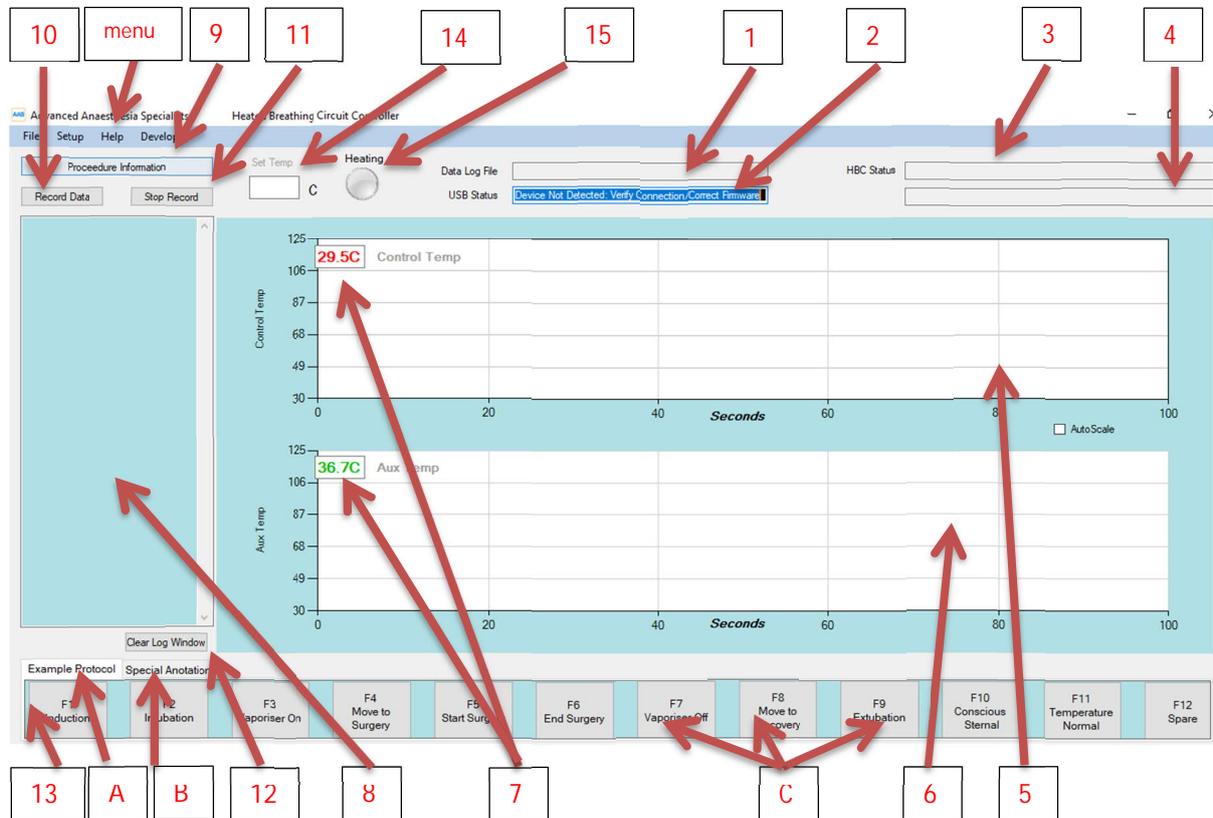

Working Areas of the Window

Figure1 Main window

The numbers and letters showing (in figure 1) are the parts of the Window and their function are detailed as working areas of the window.

1   Data Log File Status
        Displays the file name when recording

2   USB Status
        Confirms correct USB link to Control unit

3   HBC Status
        Displays whether the sensors and heater is attached and gives an error code accordingly (See System Status Codes for error code meaning)

4   Settings Status
        (Below HBC Status) gives a coded version of the settings information (See Menu Setup – Controller Options) This area also shows settings file errors if they occur.

5   Inspiratory Temperature chart
         The red (upper) chart displays a historical record of the inspired air
         temperature

6   Auxiliary Temperature chart
         The green (lower) chart displays a record of the auxiliary temperature (if
         an aux sensor is used).

7   Real Time Temperature indicators
         The real time temperatures from the inspiratory and auxiliary sensors
         are numerically displayed. In addition, if using a heated breathing tube,
         an estimate of the endo-tracheal temperature is displayed (see Note on
         Inspiratory temperature)

8   Data Logging Panel
         The left side panel displays temperature data sent from the controller
         with a date and time stamp derived from the computer's clock, and the
         system status code.

9   Procedure Information button
         Brings up an editable form regarding the procedure.
         Equipment Procedure details, and general Notes can be recorded. This
         data is saved with the temperature records when recording is activated.

10   Record Data button
         Brings up an open file dialog window. Select a file name and browse to
         the destination that the data file will be recorded to. On closing this
         dialog, recording begins, and the Data Log file (CSV format) is declared
         in the Data Log file status box

11   Stop Record button
         Stops the recording and closes the data file.

12   Clear Log button
         Clears the Data Logging Panel display. Note that this does not affect the
         recording of data to file.

13   Annotation Entry Panel
         Consists of two tabs; The Protocol tab and a Comment Annotation tab

14   Set Temp
         Displays the controller's set point temperature.

15   Heating Indicator
         Displays when power is being applied to the heater element.

A   Protocol Annotation tab
         Allows date / time stamped protocol comments to be added to the
         recorded data file. (See Protocol annotation below) To add a protocol
         comment to the data file either:-
                 Click on the appropriate button F1 to F12 (C) on the annotation
         panel
             OR   Press the appropriate F key (F1 to F12) on the keyboard

B   Comment Annotation
         Allows date / time stamped anaesthetic Flow, concentration, and
         general notes to be added to the recorded data file

Menus
File Menu

|	
New (file menu)	Starts a new file for data log recording.
Open (file menu)	Opens a file for recording purposes.
Export to CSV (file menu)	Exports an opened file to CSV (comma separated values). This format can be directly opened by Excel such that each column represents a value.
Exit (file menu)	Closes the Heated Breathing Circuit software.

Setup Menu – (Controller Options)

Figure 1: Controller Options Setup Screen

The Controller Setup window (Figure 1) when connected to the controller, displays the current system set up data in the left column (Current Setup).

In the user mode, the white boxes in the right column pertaining to control temperature, hysteresis temperature, and default temperature unit may be adjusted. When the required setup is acceptable the SAVE button writes the new set up data to the controller (stored in non-volatile memory and will be retained when the heated breathing controller is powered down).

After writing the required data to the controller, this information is then read back from the controller to verify a correct write operation and the verified data is then shown in the current HBC setup column.

Mode Menu

Figure 2: Mode

In the user version of the software temporary use of the developer mode can be accessed with a password.
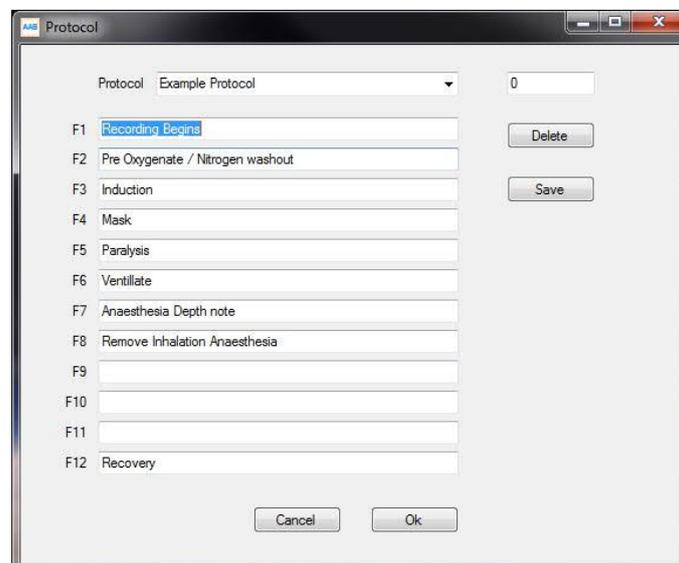

Protocol Setup Menu

Figure 3: Protocol Setup

The protocol annotation allows repeated use of known annotation points to be recorded. For instance, the start of a procedure, induction, etc. Up to twelve pre-scribed protocol sequences may be stored. The name of the protocol sequence in the figure above is called Example Protocol. As many protocol sequences as required may be saved.

Data Logging

Steps to perform data logging

1. Setup the procedure information by clicking the procedure information button and filling in the resulting screen. If you wish to skip this step the procedure information in the resulting log will be filled with blank spaces.
2. Click the record data button located in the top left corner of the screen, you will be prompted to select a save file name and location. By default, the name of the save file is the animal name or identifying reference followed by the current date and time.
3. Approximately once every 4 seconds the current time, control temp, aux temp and error state will be recorded.
4. Notes can be added using the function keys (Use protocol setup to configure these) and the add annotation tab.
5. Once the procedure is complete press the stop recording button to end recording.
6. Press the 'export to CSV' option in the file menu to export the recording to two CSV files, one containing the animals' information and notes/annotations and the other containing the recorded data. (If you don't wish to export immediately previously recorded data can be loaded via the 'open' option of the file menu).
7. The CSV files will automatically be opened in Excel if it is loaded on the working computer.

Inspiratory Temperature

For heated breathing tube, the temperature displayed is the temperature measured at the exit of the tube. The temperature probe primarily measures heat from direct conduction from the tube.

The delivered gas temperature to the top of the Endo-tracheal tube will NOT be the same as the inspired heating tube temperature.

Energy (and hence temperature) will be lost due to: -

a) Specific heat capacity of the gas and the efficiency of energy transfer into the gas
b) Gas mixing (inspired / expired) at the Y piece
c) Gas flow rates and turbulence (Reynolds Number)

By experimentation it has been found that the temperature offset (loss) between the tube measured temperature and the Endo-tracheal tube can be 8 – 10C in low flow anaesthesia. Thus, a 45C tube measurement might actually deliver 38C.

As a guide, a temperature offset value may be entered in controller set up window. If this offset value is not zero, then the Estimated Endo-Tracheal temperature will be displayed on a number box on the top right-hand side of the chart area.

Software and Controller Firmware Update

"HBC software" refers to the Windows based software running on your computer whereas the firmware is stand-alone software running on a microprocessor inside the Heated Breathing Controller unit.

From time to time both Software and Firmware improvements may be available as updates.

There are four update methods: -

1) Automated updates (Software and Firmware) – Only if the computer has a live internet connection: When the HBC program is started and an HBC controller is connected to the USB port the program will check the versions of the software and firmware being used against out update website (www.aasmedical.net). If updates are available, the program will guide the user through the process. Note that automatic updates can be turned off. (Menu Setup…. Preferences)
2) Selected Updates (Software and Firmware) - In (Menu Help …. Check for updates guides)..the user through the same update process as 1), however it is user triggered
3) Manual update (Firmware only) - (Menu Setup…. Preferences)- resets the controller. The user should manually start the upgrade program which must be installed in ("MyDirectory/AAS/HBC"). The latest version is available from http://www.aasmedical.net
4) Manual update (Software only) – download the latest version from http://www.aasmedical.netand run directly as a windows installation.

If during the upgrade of firmware process a popup as seen in Figure 4 appears, the Windows operating system has not yet registered the upgrade programmer (bootloader) yet. Please wait for 30 seconds and click OK as instructed.

Figure 4 Unable to open USB device - during upgrade of firmware

Once downloaded your HBC device will be reset into boot loader mode and the boot loader software (Figure 5) will be launched.

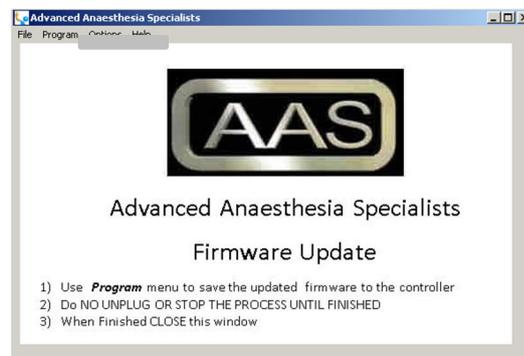

Figure 5 Programmer for Firmware update

Select 'program' from the program menu to update your device, DO NOT remove the device or switch off your computer during this process. Once the update is completed your device will be reset (Note: if the device is not reset or you decided not to update, you will be able to get out of programmer mode by simply resetting your device).

System Functionality and Fault-Finding guide

The table below describes what the responses of the Heated Breathing Controller to all conditions the system will experience are. This table details all fault conditions due to external connections possible.

Function	Condition	Response	Fault Finding Guide
0	No valid control temperature No valid auxiliary temperature No valid heater element found.	Control Indicator Off Auxiliary Indicator OFF Display reads "LEAd" System cannot heat	Heater and Auxiliary cables not plugged in (Lead Off) Heater Cable /Tube / Qube damage [Check/replace cable and/or Tube/Qube]
1	Valid control temperature No valid auxiliary temperature No valid heater element found.	Control Indicator ON Auxiliary Indicator OFF Display reads Control Temperature Value (unless out of range when display is "Or") System cannot heat	Heater Cable /Tube / Qube damage [Check/replace cable and/or Tube/Qube]
2	No valid control temperature Valid auxiliary temperature No valid heater element found.	Control Indicator OFF Auxiliary Indicator ON Display reads Auxiliary Temperature Value (unless out of range when display is "Or") System cannot heat	Only Auxiliary temperature lead plugged in [Normal Operation]

Function	Condition	Response	Fault Finding Guide
3	Valid control temperature Valid auxiliary temperature No valid heater element found.	Control Indicator and Auxiliary Indicator alternate with appropriate display Temperature Value. (Unless out of range when display is "Or") System cannot heat	Heater element open circuit or cable fault [Check/replace cable and/or Tube/Qube]
4	No valid control temperature No valid auxiliary temperature Valid heater element found.	Control Indicator Off Auxiliary Indicator OFF Display reads "LEAd" System cannot heat	Auxiliary cable not plugged in (Lead Off) Heater Cable /Tube / Qube damage [Check/replace cable and/or Tube/Qube]
5	Valid control temperature No Valid auxiliary temperature Valid heater element found.	Control Indicator ON Auxiliary Indicator OFF Display reads Control Temperature Value and System can heat to Setpoint temperature. (unless out of range when display is "Or" when System cannot heat)	[Normal Operation]
6	No valid control temperature Valid auxiliary temperature Valid heater element found.	Control Indicator OFF Auxiliary Indicator ON Display reads Auxiliary Temperature Value System cannot heat	Heater Cable /Tube / Qube damage [Check/replace cable and/or Tube/Qube]

Function	Condition	Response	Fault Finding Guide
7	Valid control temperature Valid auxiliary temperature Valid heater element found.	Control Indicator and Auxiliary Indicator alternate with appropriate display Temperature value, and System can heat to a Setpoint Control temperature (unless control temperature is out of range when display is "Or" when System cannot heat)	[Normal Operation]
8	If the controller has no mains power to it, and the USB socket is powered by a computer or 5Volt supply	The Display reads "SUPy" The System cannot heat	Mains supply is absent. [Check the switch and fuse at the back of the controller, and the external mains]
9	If the heating element load is less than 11ohms – or is Short circuited	An Overcurrent detection system in the Heated breathing controlled detects overcurrent and switches OFF the heater output. The display reads "OVLd" and the microprocessor locks out any further operation.	Overload detected. [Switch the Controller OFF and remove /replace the Tube or Qube heater load and the cable supplying them. Normal controller operation will resume when the unit is powered up again without the Short circuit as load]

The same functionality is also presented here are a flow chart (next page).
